State-of-the-art Silicon-on-Sapphire pressure transducers and transmitters have a proven track record in the aerospace, flight test, plastics and downhole markets. Piezoresistive strain gauges grown onto a single-crystal radiation-hardened structure have negligible hysteresis. Silicon-on-Sapphire is a perfect electrical insulator that does not require silicon diode isolation junctions found on diffused semiconductor pressure transducers and transmitters. Silicon-on-Sapphire is chemically inert allowing compatibility with virtually all measured media.

A Silicon-on-Sapphire pressure transducer offers a significant improvement in performance over diffused semiconductor technologies at competitive prices. These pressure transducer and pressure transmitter sensor products are perfect for high volume OEM pressure sensing applications on gas pipelines, downhole and applications where a highly accurate pressure and temperature measurements are required in tough environments.

A Silicon-on-Sapphire pressure transducer provides a total error of ± 0.1% FSO with effectively no hysteresis. Long term drift of less than ±1% FSO and proof pressures up to 5X the rated line pressure are additional features of these versatile transducers.

Electron beam welded stainless steel construction compliant with MRO-175 for corrosive service and rated for depths of 6000 meters (20,000 ft) are standard features.
